

THIRUTHANGAL NADAR COLLEGE

(Belongs to the Chennaivazh Thiruthangal Hindu Nadar Uravinmurai Dharma Fund)

Selavayal, Chennai-51.

A Self-Financing Co-educational College of Arts & Science

Affiliated to the University of Madras

Accredited with 'B' Grade by NAAC

An ISO 9001: 2015 Certified Institution

NAME OF THE DEPARTMENT : MATHEMATICS

SUBJECT : MATHEMATICS-I(ALLIED)

TOPIC : MATRICES

STAFF NAME : CHITRA N

Matrix

$$\begin{bmatrix} 2 & 5 & 3 & 4 \\ 4 & 7 & 1 & 5 \\ 3 & 0 & 5 & 8 \end{bmatrix}$$

or,

$$\begin{pmatrix} 2 & 5 & 3 & 4 \\ 4 & 7 & 1 & 5 \\ 3 & 0 & 5 & 8 \end{pmatrix}$$

MATRICES:

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \quad A$$

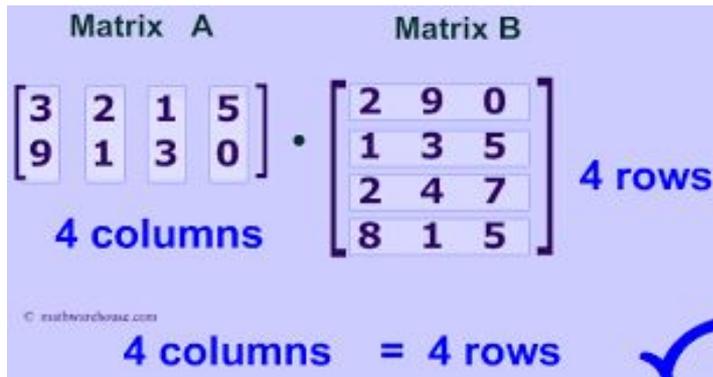

- TOPICS:
- INTRODUCTION
- TERMS USED IN MATRICES
- TYPES OF MATRICES
- TRANSPOSE AND ITS PROPERTIES
- ADJOINT AND INVERSE OF A MATRIX
- SYMMETRIC AND SKEW-SYMMETRIC MATRICES
- HERMITIAN AND SKEW-HERMITIAN MATRICES

INTRODUCTION:

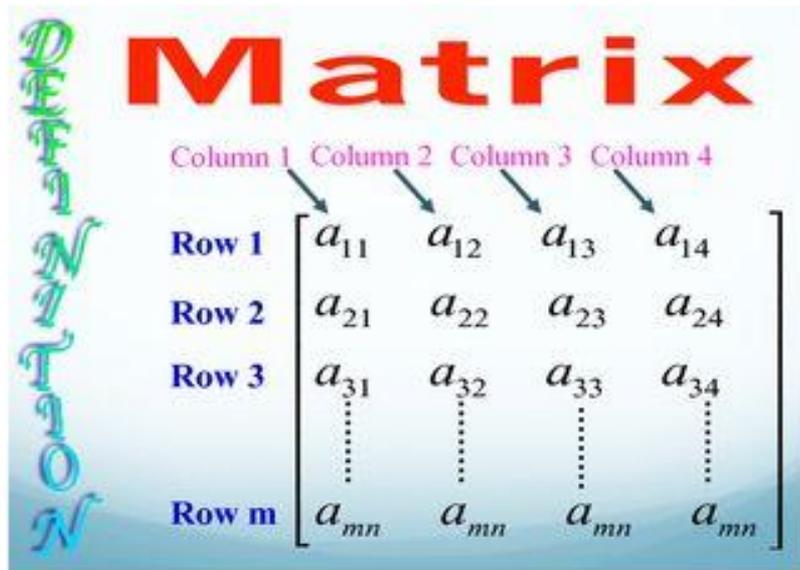

$$\begin{matrix} & \begin{matrix} 1 & 2 & \dots & n \end{matrix} \\ \begin{matrix} 1 \\ 2 \\ 3 \\ \vdots \\ m \end{matrix} & \left[\begin{array}{cccc} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ a_{31} & a_{32} & \dots & a_{3n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{array} \right] \end{matrix}$$

- A matrix (plural matrices) is a rectangular *array* or *table* of numbers, symbols, or expressions, arranged in *rows* and *columns*.
- An $m \times n$ matrix: the m rows are horizontal and the n columns are vertical. Each element of a matrix is often denoted by a variable with two subscripts. For example, $a_{2,1}$ represents the element at the second row and first column of the matrix.

TERMS USED IN MATRICES:

- Element: An individual item in a matrix.
- Rows: The horizontal line of entries in a matrix
- Columns: The vertical line of entries in a matrix

TYPES OF MATRICES:

Types of Matrices

Row Matrix

$$(a \ b \ c)$$

Column Matrix

Vector Matrix

$$\begin{pmatrix} a \\ b \\ c \end{pmatrix}$$

Zero Matrix

Null Matrix

$$\begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{pmatrix}$$

Diagonal Matrix

$$\begin{pmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{pmatrix}$$

Scalar Matrix

$$\begin{pmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{pmatrix}$$

Unit Matrix

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

- Row matrix: A matrix with a single row.
- Column matrix: A matrix with a single column.
- Square matrix: A matrix which has the same number of rows and columns.
- Identity matrix: An Identity Matrix has 1s on the main diagonal and 0s everywhere.
- Diagonal matrix: A diagonal matrix has zero anywhere not on the main diagonal.
- Scalar matrix: A scalar matrix has all main diagonal entries the same, with zero everywhere else.
- Null matrix: A matrix whose all elements are zero.

TRANSPOSE of a matrix

- The transpose of a matrix can be defined as an operator which can switch the rows and column indices of a matrix i.e. it flips a matrix over its diagonal.

- Properties of Transpose of a Matrix

- (i) Transpose of the Transpose Matrix

- If we take transpose of transpose matrix, the matrix obtained is equal to the original matrix. Hence, for a matrix A,
 - $(A')' = A$
 - What basically happens, is that any element of A, i.e. a_{ij} gets converted to a_{ji} if transpose of A is taken. So, taking transpose again, it gets converted to a_{ij} , which was the original matrix A.

- (ii) Addition Property of Transpose

- Transpose of an addition of two matrices A and B obtained will be exactly equal to the sum of transpose of individual matrix A and B.
 - This means,
 - $(A+B)' = A'+B'$

Types of Matrices

Transpose Matrix:

For a matrix $A_{m \times n}$ the transpose is defined as $A'_{n \times m}$ (in some books $A^T_{n \times m}$) where the rows and columns are interchanged.

$$A_{2 \times 4} = \begin{pmatrix} 1 & 4 \\ 3 & -2 \\ 1 & -3 \\ 0 & 1.2 \end{pmatrix} \rightarrow A'_{4 \times 2} = \begin{pmatrix} 1 & 3 & 1 & 0 \\ 4 & -2 & -3 & 1.2 \end{pmatrix}$$

- Transposed of a row vector is a column vector and vice versa.

$$X_{3 \times 1} = \begin{pmatrix} 1 \\ 5 \\ 4 \end{pmatrix} \rightarrow X'_{1 \times 3} = (1 \quad 5 \quad 4)$$

Properties of Transpose Matrix:

- By the definition of transpose matrix we can conclude $(A')' = A$.
- By the definition, $I' = I$. *This property is true for all diagonal matrices.*
- For a square matrix A, if $A' = A$, then A is a **symmetric matrix**. $\begin{pmatrix} 1 & 0.5 \\ 0.5 & 3 \end{pmatrix}$
- $(kA)' = kA'$

(iii) Multiplication by Constant

- If a matrix is multiplied by a constant and its transpose is taken, then the matrix obtained is equal to transpose of original matrix multiplied by that constant. That is,
- $(kA)' = kA'$, where k is a constant

(iv) Multiplication Property of Transpose

- Transpose of the product of two matrices is equal to the product of transpose of the two matrices in reverse order. That is
- $(AB)' = B'A'$

$$A = (A^T)^T = \begin{pmatrix} 4 & -1 & 2 \\ 5 & 0 & 3 \end{pmatrix} \quad B = \begin{pmatrix} 2 & -1 & 1 \\ 7 & 5 & -2 \end{pmatrix}$$

$$A + B = \begin{pmatrix} (4+2) & (-1-1) & (2+1) \\ (5+7) & (0+5) & (3-2) \end{pmatrix}$$

$$(A + B)^T = \begin{pmatrix} 6 & -2 & 3 \\ 12 & 5 & 1 \end{pmatrix}$$

$$(A + B)^T = \begin{pmatrix} 6 & 12 \\ -2 & 5 \\ 3 & 1 \end{pmatrix} \text{-----(1)}$$

ADJOINT AND INVERSE OF A MATRIX:

$$[C] = \begin{bmatrix} -61 & 11 & -34 \\ -17 & -41 & -26 \\ -53 & -29 & -2 \end{bmatrix}, \quad \text{adj}[A] = \begin{bmatrix} -61 & -17 & -53 \\ 11 & -41 & -29 \\ -34 & -26 & -2 \end{bmatrix}$$

Finding inverse of matrix using adjoint

teachoo.com

Let's learn how to find inverse of matrix using adjoint

But first, let us define adjoint.

For matrix A,

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

Adjoint of A is,

$$\text{adj } A = \text{Transpose of } \begin{bmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \\ A_{31} & A_{32} & A_{33} \end{bmatrix}$$

- The adjoint of a matrix (also called the adjugate of a matrix) is defined as the transpose of the cofactor matrix of that particular matrix. On the other hand, the inverse of a matrix A is that matrix which when multiplied by the matrix A give an identity matrix.

SYMMETRIC AND SKEW-SYMMETRIC MATRICES:

Symmetric matrix & Skew Symmetric Matrix

- Symmetric: $A^T = A$.
- Skew-symmetric: $A^T = -A$.
- Examples:

$$\begin{bmatrix} 1 & 1 & -1 \\ 1 & 2 & 0 \\ -1 & 0 & 5 \end{bmatrix} \quad \begin{bmatrix} 0 & 1 & -2 \\ -1 & 0 & 3 \\ 2 & -3 & 0 \end{bmatrix}$$

- A matrix is symmetric if and only if it is equal to its transpose. All entries above the main diagonal of a symmetric matrix are reflected into equal entries below the diagonal.

A matrix is skew-symmetric if and only if it is the opposite of its transpose. All main diagonal entries of a skew-symmetric matrix are zero.

HERMITIAN AND SKEW-HERMITIAN MATRICES:

HERMITIAN AND SKEW-HERMITIAN MATRIX

A square matrix $A = [a_{ij}]$ is said to be

Hermitian matrix if $a_{ij} = \overline{a_{ji}}$

$$A = A^T$$

Eg $A = \begin{bmatrix} a & b+ic \\ b-ic & d \end{bmatrix}$

$$A^T = \begin{bmatrix} a & b-ic \\ b+ic & d \end{bmatrix}$$

- **Hermitian matrix:** A square matrix such that a_{ij} is the complex conjugate of a_{ji} for all elements a_{ij} of the matrix i.e. a matrix in which corresponding elements with respect to the diagonal are conjugates of each other. The diagonal elements are always real numbers.

- **Skew-Hermitian matrix:** A square matrix such that

$$a_{ij} = -\overline{a_{ji}}$$

for all elements a_{ij} of the matrix. The diagonal elements are either zeros or pure imaginaries.
